Big Data Management (HINF5018.03)

A Lecture for Data Visualization using Open Database Connectivity

- library(RODBC) & library(jsonlite) & library(ggplot2)

Min-hyung Kim, M.D., M.S.

Fellow in Healthcare Policy and Research

Division of Health Informatics

Joan & Sanford I. Weill Medical College of Cornell University

[CONTENTS]

- library(RODBC)
 - Establishing a connection to a database
 - Query table names, column (variable) names, data types, primary keys
- Refine the research question
 - Unit of observation (!)
 - e.g.) period prevalence (proportion) by gender
- library(ggplot2)
 - Grammar of graphics
 - Syntax of library(ggplot2)
- library(jsonlite)

Necessary R libraries

part.

```
# An appropriate ODBC driver should be installed in your computer first!
for (packagename in c("tidyverse", "RODBC", "maps", "jsonlite")) {
   if(!require(packagename, character.only = T)) install.packages(packagename)
detach("package:maps", unload=TRUE) # package:maps conflicts with some other packages, so load only when you need it, detach when you are done with it.
# You should be within WCMC network to connect to VITS-ARCHSQLP04 server.
# If you are not not in WCMC network, you may have to set-up the MS SQL server, using the 1000 person data set in CDMv5 format provided by LTS Computing LLC. (If you set up some other database software, you may have to change the SQL codes because the syntax may be slightly different.)
```

Or, you may just skip the library(RODBC) part and go to the library(jsonlite)

library(RODBC)

Establishing a connection to a database Query table names, column (variable) names, data types, primary keys

Why use ODBC connection?

- Your local computer hardware cannot load the entire data you would like to analyze.
- Exporting the data into hard drive in csv format and then re-loading into statistical software may be time-consuming and error-prone process.
- The computing power of the database server will be higher than that of your local computer.
- The database server may employ efficient indexing algorithms that outperforms your statistical software for certain queries.

Establishing a connection to a database

An appropriate ODBC driver should be installed in your computer first!

```
library(RODBC)
channel = odbcDriverConnect("Driver= {SQL Server};
server=VITS-ARCHSQLP04; database=OMOP_SYNTHETIC")
```

Query distinct table names

```
sqlQuery(channel, "
<u>select distinct TABLE_NAME</u>
      information_schema.columns
######################
                    TABLE_NAME
  1234567891111111111222
012345678911111111111222
                     CARE_SITE
          CDM_DRUG_EXPOSURE
                       CONCEPT
            CONCEPT_ANCESTOR
                CONCEPT_CLASS
      CONCEPT_RELATIONSHIP
             CONCEPT_SYNONYM
                CONDITION_ERA
       CONDITION_OCCURRENCE
                          DEATH
             DEVICE_EXPOSURE
                      DRUG_ERA
                DRUG_EXPOSURE
                      LOCATION
                  MEASUREMENT
                  OBSERVATION
         OBSERVATION_PERIOD
                         PERSON
      PROCEDURE_OCCURRENCE
                      PROVIDER
                  testingnote
            VISIT_OCCURRENCE
```

Query table names, column names, data types, is_nullable

```
sqlQuery(channel,
SELECT TABLE NAME, COLUMN NAME, IS NULLABLE, DATA TYPE FROM information schema.columns
                                     'VISIT_OCCURRENCE', 'CONDITION_OCCURRENCE', 'LOCATION')
WHERE TABLE_NAME in ('PERSON',
                  TABLE NAME
                                                  COLUMN_NAME IS_NULLABLE DATA_TYPE
      CONDITION OCCURRENCE
                                    CONDITION_OCCURRENCE_ID
                                                                                varchar
      CONDITION OCCURRENCE
                                                    PERSON_ID
                                                                         YES
                                                                                varchar
      CONDITION_OCCURRENCE

Refine the research question Unit of observation (!)

Refine the research question Unit of observation (!)

• E.g.) Which gender has more healthcare visits with depression diagnosis in our dataset?

Refine the research question Unit of observation (!)

- E.g.) Which gender has more healthcare visits with depression diagnosis in our dataset?
 - Among the individuals (people) who had one or more healthcare visit(s) with depression diagnosis in our dataset, which gender is more prevalent?
 - unit of observation = person
 - population for inference = population of people
 - (person-level statistics, individual-level statistics)
 - Among the healthcare visits with depression diagnosis in our dataset, which gender is more prevalent compose the larger proportion of the visits?
 - unit of observation = encounter
 - population for inference = population of encounters?
 - (encounter-level statistics? record-level statistics?)

Prevalence

Point Prevalence

• Point prevalence is the proportion of a population that has the condition at a specific point in time.

Period Prevalence

 Period prevalence is the proportion of a population that has the condition at some time during a given period (e.g., 12 month prevalence), and includes people who already have the condition at the start of the study period as well as those who acquire it during that period.

• Lifetime Prevalence

• Lifetime prevalence is the proportion of a population that at some point in their life (up to the time of assessment) have experienced the condition.

International Classification of Diseases (ICD)

- <u>Disease</u> (& related health problem) classification system maintained by the World Health Organization (WHO), the directing and coordinating authority for health within the United Nations (UN).
- The Ninth Revision of the International Statistical Classification of <u>Diseases</u>, <u>Injuries</u>, and <u>Causes of Death</u> (ICD-9): since 1978
 - ~ 17,000 codes
- The Tenth revision of the International Statistical Classification of <u>Diseases and</u> Related Health Problems (ICD-10): since 1992
 - ~ 160,000 codes
 - In the U.S., ICD-10 codes are effective 10/2015 (Prior to that, ICD-9 was still used...)
- ICD-11 in development: initially planned for 2017, but pushed back...

ICD-9 codes for Major Depressive Disorder

- Non-specific code 296 Episodic mood disorders
 - Non-specific code 296.2 Major depressive disorder single episode
 - Specific code 296.20 Major depressive affective disorder, single episode, unspecified
 - Specific code 296.21 Major depressive affective disorder, single episode, mild
 - Specific code 296.22 Major depressive affective disorder, single episode, moderate
 - Specific code 296.23 Major depressive affective disorder, single episode, severe, without mention of psychotic behavior
 - Specific code 296.24 Major depressive affective disorder, single episode, severe, specified as with psychotic behavior
 - Specific code 296.25 Major depressive affective disorder, single episode, in partial or unspecified remission
 - Specific code 296.26 Major depressive affective disorder, single episode, in full remission

- Non-specific code 296.3 Major depressive disorder recurrent episode
 - Specific code 296.30 Major depressive affective disorder, recurrent episode, unspecified
 - Specific code 296.31 Major depressive affective disorder, recurrent episode, mild
 - Specific code 296.32 Major depressive affective disorder, recurrent episode, moderate
 - Specific code 296.33 Major depressive affective disorder, recurrent episode, severe, without mention of psychotic behavior
 - Specific code 296.34 Major depressive affective disorder, recurrent episode, severe, specified as with psychotic behavior
 - Specific code 296.35 Major depressive affective disorder, recurrent episode, in partial or unspecified remission
 - Specific code 296.36 Major depressive affective disorder, recurrent episode, in full remission

library(ggplot2)

- Wickham H. ggplot2: elegant graphics for data analysis. Springer; 2016.
- https://github.com/hadley/ggplot2-book
- https://github.com/tidyverse/ggplot2

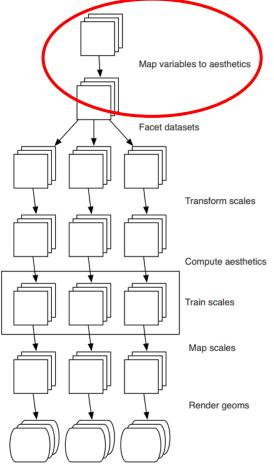

Fig. 3.7: Schematic description of the plot generation process. Each square represents a layer, and this schematic represents a plot with three layers and three panels. All steps work by transforming individual data frames, except for training scales which doesn't affect the data frame and operates across all datasets simultaneously.

Data Visualization with ggplot2:: cheat sheet

Basics Geoms ggplot2 is based on the grammar of graphics, the idea that you can build every graph from the same b <- ggplot(seals, aes(x = long, y = lat)) components: a data set, a coordinate system, and geoms—visual marks that represent data points. data coordinate plot a + geom_path(lineend="butt", linejoin="round", system To display values, map variables in the data to visual a + geom_polygon(aes(group = group)) properties of the geom (aesthetics) like size, color, and x x, y, alpha, color, fill, group, linetype, size and y locations. data plot coordinate Complete the template below to build a graph. required ggplot (data = <DATA>) + <GEOM_FUNCTION> (mapping = aes(< MAPPINGS> stat = **<STAT>**, position = **<POSITION>**) + <COORDINATE FUNCTION>+ <FACET FUNCTION> +

<SCALE_FUNCTION> + <THEME FUNCTION>

ggplot(data = mpg, aes(x = cty, y = hwy)) Begins a plot that you finish by adding layers to. Add one geom function per layer.

aesthetic mappings data geom

qplot(x = cty, y = hwy, data = mpg, geom = "point") Creates a complete plot with given data, geom, and mappings. Supplies many useful defaults.

last plot() Returns the last plot

ggsave("plot.png", width = 5, height = 5) Saves last plot as 5' x 5' file named "plot.png" in working directory. Matches file type to file extension.

Use a geom function to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer.

GRAPHICAL PRIMITIVES

a <- ggplot(economics, aes(date, unemploy))

a + geom_blank()

(Useful for expanding limits)

b + geom_curve(aes(yend = lat + 1, xend=long+1,curvature=z)) - x, xend, y, yend, alpha, angle, color, curvature, linetype, size

x, v, alpha, color, group, linetype, size

b + geom_rect(aes(xmin = long, ymin=lat, xmax= long + 1, ymax = lat + 1)) - xmax, xmin, ymax, ymin, alpha, color, fill, linetype, size

a + geom_ribbon(aes(ymin=unemploy - 900, ymax=unemploy + 900)) - x, ymax, ymin, alpha, color, fill, group, linetype, size

common aesthetics: x, v, alpha, color, linetype, size

b + geom_abline(aes(intercept=0, slope=1)) b + geom hline(aes(vintercept = lat))

b + geom_vline(aes(xintercept = long))

b + geom_segment(aes(yend=lat+1, xend=long+1)) **b + geom_spoke(**aes(angle = 1:1155, radius = 1))

cheatsheet

Rstudio Menu -Help -Cheatsheets

Data Transformation with dplyr:: cheat sheet

dplyr functions work with pipes and expect tidy data. In tidy data:

its own column

Each variable is in Each observation, or case, is in its own row

becomes f(x, y)

Summarise Cases

These apply **summary functions** to columns to create a new table. Summary functions take vectors as input and return one value (see back).

summary function

summarise(.data, ...) Compute table of summaries. Also summarise_(). summarise(mtcars, avg = mean(mpg))

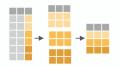

count(x, ..., wt = NULL, sort = FALSE) Count number of rows in each group defined by the variables in ... Also tally() count(iris, Species)

VARIATIONS

summarise_all() - Apply funs to every column. summarise_at() - Apply funs to specific columns. summarise if() - Apply funs to all cols of one type.

Group Cases

Use **group_by()** to created a "grouped" copy of a table. dplyr functions will manipulate each "group" separately and then combine the results.

mtcars %>% group_by(cyl) %>%

summarise(avg = mean(mpg))

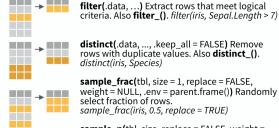

group_by(.data, ..., add = Returns copy of table grouped by ... g iris <- group by(iris, Species)

ungroup(x, ...) Returns ungrouped copy of table. ungroup(g_iris)

Manipulate Cases

EXTRACT CASES

Row functions return a subset of rows as a new table. Use a variant that ends in for non-standard evaluation friendly code.

distinct(.data, ..., .keep_all = FALSE) Remove rows with duplicate values. Also distinct_().

sample_n(tbl, size, replace = FALSE, weight = NULL, .env = parent.frame()) Randomly select size rows. sample_n(iris, 10, replace = TRUE)

top_n(x, n, wt) Select and order top n entries (by group if grouped data). top n(iris, 5, Sepal.Width)

Logical and boolean operators to use with filter()

<	<=	is.na()	%in%		xor()
>	>=	!is.na()	!	&	
Can 2h		ad 2Campaui	een for hal	n	

See ?base::logic and ?Comparison for help

ARRANGE CASES

arrange(.data, ...) Order rows by values of a column (low to high), use with desc() to order from high to low. arrange(mtcars, mpg) arrange(mtcars, desc(mpg))

ADD CASES

add_row(.data, ..., .before = NULL, .after = NULL) Add one or more rows to a table. add_row(faithful, eruptions = 1, waiting = 1)

Column functions return a set of columns as a new table. Use a variant that ends in _ for non-standard evaluation friendly code.

select(.data, ...)

Extract columns by name. Also select if() select(iris, Sepal.Length, Species)

Use these helpers with select (), e.g. select(iris, starts_with("Sepal"))

contains(match) **num range**(prefix, range) :, e.g. mpg:cyl -, e.g, -Species ends_with(match) one_of(...) matches(match) starts_with(match)

MAKE NEW VARIABLES

These apply **vectorized functions** to columns. Vectorized funs take vectors as input and return vectors of the same length as output (see back).

vectorized function

transmute(.data, ...) Compute new column(s), drop others. transmute(mtcars, qpm = 1/mpq)

mutate_all(.tbl, .funs, ...) Apply funs to every column. Use with funs(). mutate_all(faithful, funs(log(.), log2(.)))

mutate_at(.tbl, .cols, .funs, ...) Apply funs to specific columns. Use with funs(), vars() and the helper functions for select(). mutate at(iris, vars(-Species), funs(log(.)))

mutate_if(.tbl, .predicate, .funs, ...) Apply funs to all columns of one type. Use with **funs()**. mutate_if(iris, is.numeric, funs(log(.)))

add_column(.data, ..., .before = NULL, .after = NULL) Add new column(s). add column(mtcars, new = 1:32)

rename(.data, ...) Rename columns. rename(iris, Length = Sepal.Length)

cheatsheet

Rstudio Menu -Help -Cheatsheets

Vectorized Functions

TO USE WITH MUTATE ()

mutate() and transmute() apply vectorized functions to columns to create new columns. Vectorized functions take vectors as input and return vectors of the same length as output.

vectorized function

OFFSETS

dplvr::lag() - Offset elements by 1 dplyr::lead() - Offset elements by -1

CUMULATIVE AGGREGATES

dplyr::cumall() - Cumulative all() dplyr::cumany() - Cumulative any() cummax() - Cumulative max() dplyr::**cummean()** - Cumulative mean() **cummin()** - Cumulative min() cumprod() - Cumulative prod() cumsum() - Cumulative sum()

RANKINGS

dplyr::cume dist() - Proportion of all values <= dplyr::dense_rank() - rank with ties = min, no dplyr::min_rank() - rank with ties = min dplyr::ntile() - bins into n bins dplyr::percent_rank() - min_rank scaled to [0,1] dplyr::row_number() - rank with ties = "first"

MATH

+, -, *, /, ^, %/%, %% - arithmetic ops log(), log2(), log10() - logs <, <=, >, >=, !=, == - logical comparisons

MISC

dplyr::between() - x >= left & x <= rightdplyr::case_when() - multi-case if_else() dplyr::coalesce() - first non-NA values by element across a set of vectors dplyr::if_else() - element-wise if() + else() dplyr::na_if() - replace specific values with NA pmax() - element-wise max() **pmin()** - element-wise min() dplyr::recode() - Vectorized switch() dplyr::recode_factor() - Vectorized switch() for factors

Summary Functions

TO USE WITH SUMMARISE ()

summarise() applies summary functions to columns to create a new table. Summary functions take vectors as input and return single values as output.

summary function

COUNTS

dplyr::**n()** - number of values/rows dplvr::n distinct() - # of uniques sum(!is.na()) - # of non-NA's

LOCATION

mean() - mean, also mean(!is.na()) median() - median

LOGICALS

mean() - Proportion of TRUE's sum() - # of TRUE's

POSITION/ORDER

dplyr::first() - first value dplvr::last() - last value dplvr::nth() - value in nth location of vector

RANK

quantile() - nth quantile min() - minimum value max() - maximum value

SPREAD

IQR() - Inter-Quartile Range mad() - mean absolute deviation sd() - standard deviation var() - variance

Row Names

Tidy data does not use rownames, which store a variable outside of the columns. To work with the rownames, first move them into a column.

rownames_to_column() Move row names into col. 2 b u 2 b u 3 c v = "C") Move row names into col. 2 c v a <- rownames_to_column(iris, var

Also has_rownames(), remove_rownames()

Combine Tables

COMBINE VARIABLES

Use bind_cols() to paste tables beside each other as they are.

bind_cols(...) Returns tables placed side by side as a single table. BE SURE THAT ROWS ALIGN.

Use a "Mutating Join" to join one table to columns from another, matching values with the rows that they correspond to. Each join retains a different combination of values from the tables.

ABCD left_join(x, y, by = NULL, a t 13 copy=FALSE, suffix=c(".x",".y"),...) b u 2 2 c v 3 NA Join matching values from y to x.

right_join(x, y, by = NULL, copy = at 13 FALSE, suffix=c(".x",".y"),...) bu 2 2 Join matching values from x to y.

Inner_join(x, y, by = NULL, copy = a t 1 3 FALSE, suffix=c(".x",".y"),...) Join data. Retain only rows with matches.

ABCD full_join(x, y, by = NULL, a t 1 3 copy=FALSE, suffix=c(".x",".y"),...) c v 3 NA Join data. Retain all values, all rows.

A B. x C By D Use **by** = x C ("col1", "col2") to a t 1 t 3 b u 2 u 2 specify the column(s) to match on. c v 3 NA NA left join(x, y, by = "A")

A.x B.x C A.V B.Y Use a named vector, $\mathbf{by} = \mathbf{c}(\mathbf{col1''} = \mathbf{col1''})$ a t 1 d w "col2"), to match on columns with c v 3 a t different names in each data set. $left_join(x, y, by = c("C" = "D"))$

A1 B1 C A2 B2 Use **suffix** to specify suffix to give to a t 1 d w duplicate column names.

COMBINE CASES

АВС

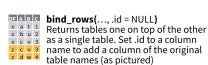

a t 1

X c v 3

y dw4

Use **bind_rows()** to paste tables below each other as they are.

Use **setequal()** to test whether two data sets contain the exact same rows (in any order).

EXTRACT ROWS

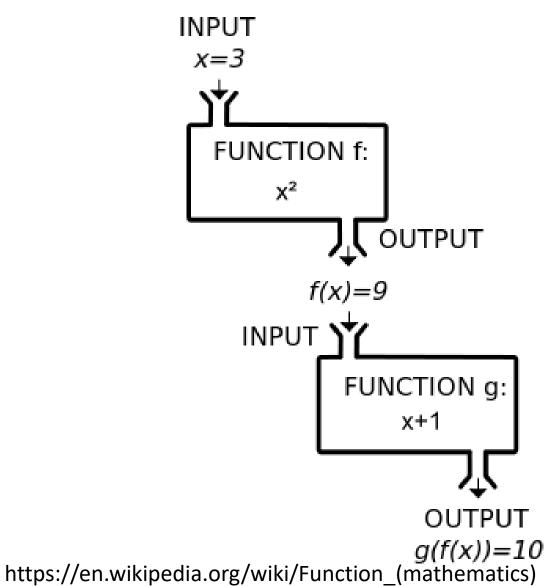

Use a "Filtering Join" to filter one table against the rows of another.

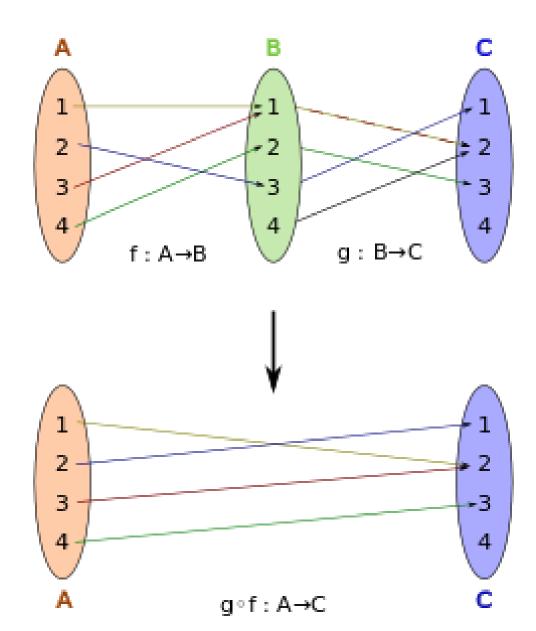

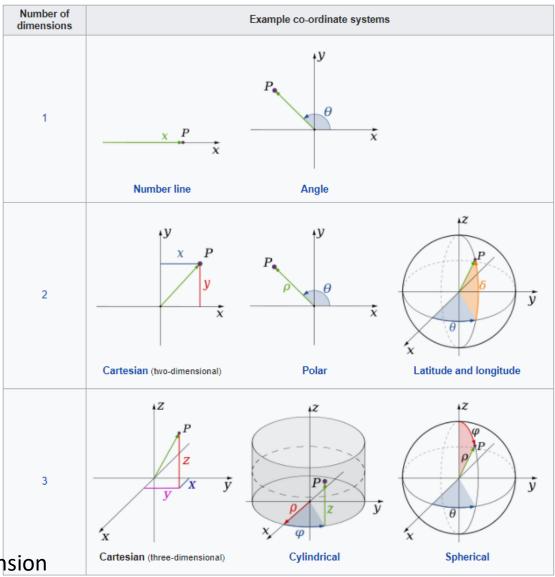

function $f:X \rightarrow Y$ (f maps X into Y)

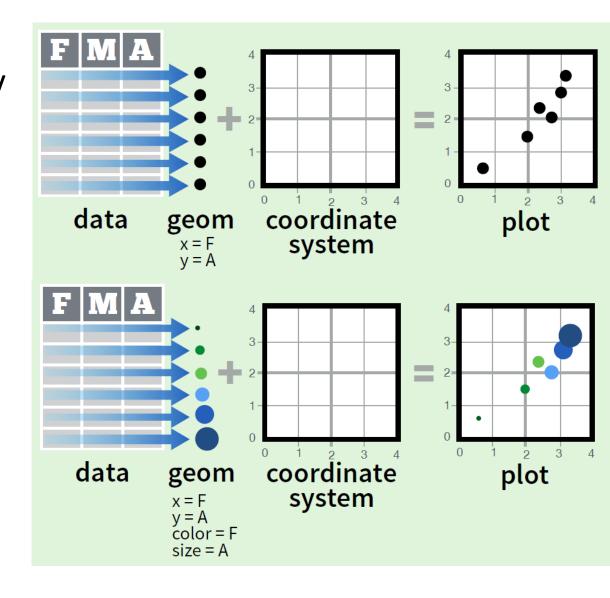

Dimension

https://en.wikipedia.org/wiki/Dimension

ggplot2

- ggplot2 is based on the grammar of graphics, the idea that you can build every graph from the same components: a data set, a coordinate system, and geoms—visual marks that represent data points.
- To display values, <u>map variables</u> in the data to <u>visual properties of the geom</u> (<u>aesthetics</u>) like size, color, and x and y locations.

ggplot2 syntax

```
Required
ggplot(data = <DATA>
  <GEOM_FUNCTION>
    mapping = aes( <MAPPINGS> ),
    stat = <STAT>
                                     Not
    position = <POSITION>
                                     required,
                                     sensible
  <COORDINATE_FUNCTION>
                                     defaults
                                     supplied
  <FACET_FUNCTION>
  <SCALE_FUNCTION>
  <THEME FUNCTION>
```

Period Prevalence, by Year, by Gender

Independent variables = group_by(VISIT_START_YEAR, <u>GENDER_SOURCE_VALUE</u>)

Dependent variable = n_distinct(PERSON_ID)

How to convert text data type into datetime type in MS SQL Server

- https://docs.microsoft.com/en-us/sql/t-sql/functions/cast-andconvert-transact-sql
- -- Syntax for CONVERT:
